

# Padmount Style SF<sub>6</sub> Insulated Switching Solutions

Providing load and fault interrupting switching for systems rated through 38kV, 900A continuous, to 25kA symmetrical interrupting

- Smart Grid/Lazer® Solutions
- Front and front/back access designs
- Dead-front designs
- Compact construction
- Maintenance-free operation
- Two and three position switching
- Mounting flexibility
- Ease of Automation

# General Features

Since 1905, G&W has provided custom power solutions to utilities and electric power users around the world. G&W has a wide selection of reliable, quality switching and fault interrupting products to meet the most stringent customer requirements. Whether the application involves load switching, line sectionalizing, fault interruption or distribution automation, G&W can provide a solution for distribution system switching and protection. When specifying switchgear, consider these features:

## MAXIMUM OPERATOR SAFETY

SF<sub>6</sub> gas is a nontoxic, nonflammable switching dielectric. Dead-front switch construction eliminates any exposed live parts. Spring-assisted mechanisms assure quick-make, quick-break operation. Viewing windows permit visual verification of open or closed contacts. Tamper-resistant enclosures utilize penta-head bolts and padlocking provisions. Motor actuators are available permitting remote operation. The result is maximum operator safety.

## MINIMAL MAINTENANCE

G&W SF<sub>6</sub> switches are corrosion-resistant, totally sealed and factory filled. No more field adjustments of critical contact areas or concerns with environmental contamination or intrusions. A periodic check of the pressure gauge is all that is required. Galvaneal type enclosures assure maximum corrosion resistance.

## APPLICATION VERSATILITY

**Multi-way Configurations** — Switches are available for either two-position or three-position (incorporating an integral ground, tie or test position) switching. Single or multiple sources can feed multiple loads. Bus tie configurations are available permitting multiple sources to feed different loads within the same switch.

**Mounting Flexibility** — Horizontal and vertical configurations are available with operating apparatus accessible from the front, top or side compartments. Enclosures are removable for easy cable installation or field replacement.

**Bushing Variety** — Many bushing styles are available including an exclusive disconnectable style permitting field changeout. Cable entry can be bottom, front, back or side.

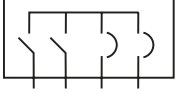

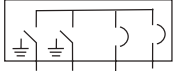

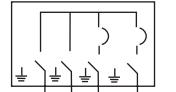

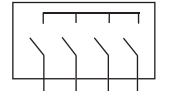

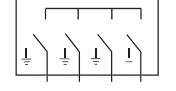

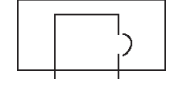

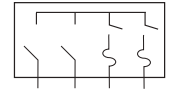

**Visible Break** — Load break switches can incorporate a visible break of all three phases.

**Overcurrent Protection** — Fusing or electronically controlled, resettable vacuum interrupters are available.

**Smart Grid / Lazer Solutions** — Complete distribution automation and Smart Grid solutions are available including automatic transfer. G&W's Lazer distribution automation systems provide pre-engineered, time-proven solutions for automatic power restoration.

# Table of Contents

Typical One-Line Diagram	Application	G&W Switch Style	Page
	Load break switching and fault interrupting	RPF1 - most compact footprint LPFI - superior switch contact viewing PNI/PNI-L - 38kV and high interrupting ratings PVI - available with 1-phase tripping	5 6 7, 15 8, 13
	Load break switch with integral ground and fault interrupting	TFI - Triad Series 1 with 3-phase tripping TVI - Triad Series 1 with 1-phase tripping	17 18, 20
	Load break with integral ground and fault interrupting with integral ground	TNI - Triad Series 2	22
	Load break switching only	SPRAM-F - front operators and diagonal bushings PRAM-F - front operators and in-line bushings PRAM-L - front operators, back bushings	24 24 26
	Load break with integral ground	T-RP - front operators and in-line bushings	27
	Fault interrupting only	PFI with 3-phase tripping PVI with 1-phase tripping PNI for 38kV, to 25kA	28 28 28
	Load break switching with current limiting fuses	FPRAM to 40A	29

# Load and Fault Interrupting Switches

## PUFFER VACUUM INTERRUPTERS

G&W load and fault interrupting combination switches combine the total cost and operating benefits of fuseless, electronically controlled, resettable overcurrent protection with the safety and maintenance benefits of a totally sealed, dead-front, SF<sub>6</sub> insulated device. The switches are designed for automatic single or three phase fault interruption with manual load break capabilities for systems through 35kV, 630A continuous. Ratings to 900A continuous are available on certain models. Single side access designs are available for confined space applications.

## FEATURES

**Operator Safety** — G&W combination switches are totally sealed, dead-front and insulated with nonflammable, nontoxic SF<sub>6</sub> gas. Operators are spring assisted for positive quick-make, quick-break operation. A trip-free mechanism permits interruption independent of the operating handle if closing into a fault. Viewing windows permit visible indication of interrupter contact position.

**Minimal Maintenance** — No more routine inspections or dielectric testing as with oil gear. No more contact contamination, rodent problems or insulator maintenance as with air gear. A periodic check of the gas pressure gauge is all that is required.

**Three Phase Tripping** — No more single phasing problems. Simultaneous three phase tripping is available through the electronics and with three phase operating handles for manual operation and reset.

**Protection Curve Compatibility** — G&W solid state electronic controls permit extremely accurate, consistent protection curve characteristics compared to conventional fuses. The exclusive controls can emu-

▲ PNI single side access switch.

late the most common time current curves (TCC) for power fuses, relays and fuse links (oil fuse cutouts). Optional controls can provide ground trip, inrush restraint and adjustable time delay capability.

**Fully Tested** — Switches are designed and tested per applicable sections of IEEE C37.72, C37.74 C37.60, and IEC 265 standards.

## APPLICATIONS

G&W combination switches provide a direct replacement for power fused air and vacuum-in-oil switchgear. Some ideal applications include:

**Transformer and Motor Protection** — The three phase trip feature and high continuous current make PVIs ideal for protecting three phase motors and transformers through 600A continuous.

**Loop and Tap Switching** — Standard 630A and optional 900A loop switching is accomplished using the latest puffer technology. Tap switching through 630A and up to 25kA symmetric fault protection is accomplished using resettable, electronically controlled vacuum interrupters. The vacuum interrupters also function as load break switches.

**Automatic Transfer** — For critical load applications, switches can be supplied with an automatic transfer control package to provide automatic transfer from one source to another to minimize downtime.

**Smart Grid / Lazer Solutions** — Switches can be supplied with motor actuators on both the line and load side providing remote control capability. Various control packages including portable controls are available.

For Smart Grid applications, G&W works with the top control manufacturers of the industry, including Schweitzer and GE, to match the right control for the job. For automatic power restoration, G&W's Lazer solution provides a pre-engineered, field proven system which can be pre-assembled and factory tested prior to shipment.

**Metalclad Switchgear Replacement** — Front access designs can provide up to a 900A rated main bus with up to six 25kA symmetric protected load ways for a compact, economical alternative to metalclad and metal enclosed line-ups. All switches can be equipped with SEL relays, providing flexibility, as well as complete remote monitoring and control capabilities.

# Load and Fault Interrupting Switches

## TWO POSITION, FRONT ACCESS, PUFFER VACUUM INTERRUPTERS CONTINUED

For typical specifications, go to:  
[gwelec.com/specs.html](http://gwelec.com/specs.html)

For contact principle, see pages 30-33.

Switch Style Height and Depth:

For RPFI styles:  
height = 59" (1499mm),  
depth = 49" (1245mm).

For LPFI styles:  
height = 61" (1549mm),  
depth = 54" (1372mm).

For PNI styles:  
height = 65" (1651mm),  
depth = 55" (1397mm).

For PVI styles:  
height = 57" (1448mm),  
depth = 54.5" (1384mm).

*Dimensions are approximate.

# Load and Fault Interrupting Switches

## Two Position, Front / Back Access, PVI Style, Puffer Vacuum Interrupters

Provides front and back compartments for separating source and tap cables. Load break switch operating mechanisms are located on the sides of the switch. Fault interrupters can be changed from single phase to three phase protection in the field. Provides load break switch visible break with 12 or 20kA symmetrical single or three phase fault interrupting.

### Load break switch (LP) ratings

Maximum design voltage,		
kV .....	15.5 .....	27 .....
Voltage class,		
kV .....	15 .....	25 .....

# Load and Fault Interrupting Switches

## THREE POSITION, FRONT ACCESS, TRIAD™ SERIES 1 WITH LOAD BREAK GROUND SWITCHES

Switches incorporate rotary puffer style internal ground for the load break switch ways. Two models offer different ratings and vacuum interrupter capabilities as follows:

### Model TFI

Provides three phase protection.

### Load break switch (RP) ratings

Maximum design voltage, kV .....	15.5.....	27
Voltage class, kV .....	15.....	25
Impulse level (BIL), kV .....	110.....	125
One minute withstand, AC kV .....	35.....	60
One minute withstand, Production test rating AC kV .....	34.....	40
15 minute withstand, DC kV .....	53.....	78
Continuous and load break current, Amps .....	630.....	630
Momentary current, kA asym .....	40.....	40
Fault-close current, (3 times) kA asym .....	32.....	32
One second current kA sym .....	25.....	25
Mechanical endurance, operations .....	2000.....	2000

### Fault interrupter (FI) ratings

Maximum design voltage, kV .....	15.5.....	27
Voltage class, kV .....	15.....	25
Impulse level (BIL), kV .....	110.....	125
One minute withstand, AC kV .....	50.....	60
One minute withstand, Production test rating AC kV .....	34.....	40
15 minute withstand, DC kV .....	53.....	78
Continuous and load break current, Amps .....	630.....	630
Symmetrical interrupting rating, kA .....	12.5.....	16

▲ TFI-6F

### IEEE C37.60

#### Fault Interrupting Duty

Dimensions are approximate.  
Do not use for construction.

All voltage classes have a height = 53" (1346mm); and depth = 73" (1854mm).

# Two Position Load Break Switches

## TWO POSITION LOAD BREAK, FRONT ACCESS, SPRAM-F / PRAM-F

Available in rotary puffer (RP) and linear puffer (PI) designs.

**SPRAM-F** styles provide the most compact construction due to diagonal bushing arrangements with a 6-1/2" phase spacing. These models can accommodate bushing mounted fuses.

**PRAM-F** styles incorporate in-line bushing arrangements with a 5" phase spacing. Bushings can be top, bottom, front or side mounted.

# Three Position Load Break Switches

## THREE POSITION LOAD BREAK, FRONT ACCESS, T-RP STYLE (Close-Open-Ground)

An integral ground position within the switch tank permits safe and easy grounding of the cable circuit without having to disconnect elbow or other cable entrance connections. Switching to ground is accomplished through the simple throw of the operating handle without having to de-energize other circuits through the switch. This feature is beneficial for applications where cable movement needs to be minimized. Ground stops with padlocking provisions help assure proper operation to the desired position.

# Fault Interrupting Switches

## VACUUM INTERRUPTERS

G&W Vacuum Interrupters combine the total cost and operating benefits of fuseless, electronically controlled, resettable overcurrent protection with the safety and maintenance benefits of a totally sealed, dead-front SF<sub>6</sub> insulated device. The switches are designed for automatic single or three phase fault interruption with manual load break capabilities for systems through 38kV, 630A continuous.

# Fault Interrupting Switches

## TWO POSITION, FRONT ACCESS FUSED FPRAM-F STYLE

▲ Canister fuses incorporate a provision for hookstick removal and replacement.

G&W's fused FPRAM-F style switches combine linear puffer (LP) contacts for source switches with rotary puffer (RP) contacts for fused ways. Bushings can be front or bottom mounted. For applications requiring current limitation and over-current interruption through 50kA symmetrical, air canister style current limiting fusing is available.

### CANISTER FUSES

For new orders, integral air insulated, canister style current limiting fusing is available for systems through 23kV. Canister style fused switches feature compact, dead-front construction with mechanical or key interlocking arrangements preventing access to the fuses unless the switch is in the open position. Safe, quick fuse replacement is accomplished using conventional tools and without exposing switch dielectric or current carrying parts to environmental contamination. Two fuses can be connected in parallel to double the capacity rating of the switch. The general purpose fuses are IEEE C37.473.C rated and can interrupt both high and low level fault currents while limiting the available fault current on the system.

# Contact Principles

## MODEL FI AND NI VACUUM INTERRUPTER MECHANISM PRINCIPLE

Add to appropriate switch specifications.

Ratings for FI modules available through 25kV, with 12.5kA symmetric interrupting. Ratings for NI modules available through 35kV, with 12.5kA, 20kA and 25kA symmetric interrupting.

The model FI and NI vacuum interrupters consist of three vacuum bottles mechanically linked to a single spring-assisted operating mechanism. Once initiated, the interrupting time of the vacuum bottles is approximately 3 cycles (50 millisecond). A position indicator (open-green, closed-red) driven by the operating mechanism and is visible through a viewing window for positive contact position. The mechanical linkage assembly provides a "trip-free" operation permitting the vacuum interrupter to interrupt independent of the operating handle if closing into a faulted circuit.

The control monitors the current on each phase and activates a trip solenoid to open the three vacuum bottles if an overcurrent on any phase is sensed. The control is self-powered by current transformers mounted inside the sealed switch tank. No external power source is required. Load current is required for the control to be activated unless the optional remote power feature is specified. The trip selector is used to select the time-current response curve for the tap circuits. The time-current response curves are chosen with the phase selector switches on the face plate of the control. Selection of time-current characteristics may be made under load or no-load conditions with continuous current ranges in twelve selectable levels.

The manual trip and reset of the vacuum interrupter is accomplished through a single handle operating all three phases simultaneously.

◀ Model FI three phase mechanism.

Model NI three phase mechanism. ▶

◀ Three phase interrupter operating handle for manual three phase operation and reset.

Motor actuators (below) can be added for remote operation. ▼

▲ Position indicators provide visible verification of contact position through viewing windows. ▶

Motor actuators can be provided. Optional push-button on the controls also permit manual tripping.

# Contact Principles

## MODEL VI VACUUM INTERRUPTER MECHANISM PRINCIPLE

Add to appropriate switch specifications.

Ratings available through 35kV, with 12kA interrupting with an option for 20kA. Mechanisms are field retrofittable between single phase and three phase operation.

For single phase operation, the model VI vacuum interrupter consists of a single vacuum bottle mechanically linked to a spring-assisted operating mechanism. For three phase operation, the single phase mechanisms are mechanically linked together with an external operating handle assembly. These mechanisms are field retrofittable between single phase and three phase operation. In both cases, once initiated, the interrupting time of the vacuum bottles is approximately 3 cycles (50 millisecond). A position indicator (open-green, closed-red) is mounted to the moving contact and is visible through a viewing window for positive contact position. The mechanical linkage assembly provides a "trip-free" operation permitting the vacuum interrupter to interrupt independent of the operating handle if closing into a faulted circuit.

The control monitors the current on each phase and activates a trip solenoid to open one or all three vacuum interrupters if an overcurrent on any phase is sensed. The control is self-powered by current transformers mounted inside the sealed switch tank. No external power source is required. Load current is required for the control to be activated unless the optional remote power feature is specified. The trip selector is used to select the time-current response curve for the tap circuits. Factory setting for single or three phase tripping is standard.

◀ Single phase VI mechanism.

Photos below: Interrupter operating handles for manual single phase (below) or three phase (left) operation and reset. Motor actuators can be added to three phase for remote operation.

Position indicators (right) provide ▶ contact position indication through viewing windows.

The time-current response curves are chosen with the phase selector control. Selection of time-current characteristics may be made under load or no-load conditions with continuous current ranges in twelve selectable levels.

The manual trip and reset of the vacuum interrupter is accomplished through an operating handle. Motor actuators can be provided for remote control. Optional push-button on the control also permits manual tripping.

# Contact Principles

## TWO POSITION, ROTARY PUFFER STYLE

G&W's patented Rotary Puffer (RP) style, two-position switches are ideal for manual load break switching, automatic transfer or automated sectionalizing applications rated through 25kV, 630A continuous. This module allows for the smallest switch footprint. Switches are tested to 500 loadbreak operations at 15kV and 350 operations at 25kV. Switches also tested to 2000 mechanical operations. Current limiting fuses or electronically controlled vacuum interrupters can be added for overcurrent protection. G&W's RP style contact system provides extremely efficient, high speed arc extinction for maximum service life.

▲ Two position rotary puffer mechanism.

## TWO POSITION, ROTARY PUFFER CONTACT PRINCIPLE

**A.** The stationary contacts and the multi-chamber rotor (an assembly of interlocking parts which form a rotational framework including moving contacts) are housed in a clear cylindrical shell. The stationary contacts are supported independent of the cable entrance bushings, eliminating possible misalignment resulting from tank deflections. Tank deflections are caused by normal tank pressure variance due to ambient temperature fluctuations. Each rotating contact simultaneously disengages from two stationary contacts, providing two break points per phase. This provides improved interrupting capability as compared to single break contact systems.

**B.** As the rotor tube assembly turns to disengage the moving contact from the stationary contacts, dielectric media ( $\text{SF}_6$  gas) is compressed between the impeller and stator. The shell, phase barrier and rotor tube also act to confine the gas for proper compression and flow. The compressed  $\text{SF}_6$  gas is directed through the nozzle into the arc zone. The  $\text{SF}_6$  flows (is puffed) across the contacts and around the arc established by the separating contacts, cooling the arc over the length of the nozzle. The cooling action is increased by the higher pressure (due to compression) and the flow of gas which constantly provides a supply of cool  $\text{SF}_6$  into the arc zone.

At current zero, the temperature of the arc is reduced to the point of deionization. The  $\text{SF}_6$  gas rapidly recovers dielectric strength withstanding the system recovery voltage and preventing re-ignition of current across the contacts.

**C.** As the rotor tube assembly turns to engage the moving contact with the stationary contacts, the impeller induces a flow of  $\text{SF}_6$  gas between the contacts to minimize pre-strike.

# Contact Principles

## TWO POSITION, LINEAR PUFFER STYLE

G&W's patented Linear Puffer (LP) style, two-position switches are ideal for heavy duty manual load break switching, automatic transfer or automated sectionalizing applications rated through 35kV, 900A continuous and 40kA asymmetrical short circuit. Switches are tested to 1200 loadbreak and 2000 mechanical operations. Current limiting fuses or electronically controlled vacuum interrupters can be added for overcurrent protection. G&W's LP style contact system provides extremely efficient, high speed arc extinction for maximum service life.

### Stored Energy Mechanism

Linear puffer switches can be supplied with internal stored energy (cock and trip) mechanisms for both the open and close operators permitting high speed local or remote operation. A separate external trip handle is provided. An optional internal solenoid permits remote operation.

▲ Three phase visible position of contacts.

▲ Three phase linear puffer mechanism.

## TWO POSITION, LINEAR PUFFER CONTACT PRINCIPLE

**CLOSED      OPENING      OPEN      CLOSING**

**A.** The stationary contact and piston assembly (containing the moving contact and nozzle) are housed in clear cylindrical tubes. These are mounted in a modular three-phase assembly which is independent of the switch tank. The stationary contacts are supported independent of the cable entrance bushings, eliminating possible misalignment resulting from tank deflections. Tank deflections are caused by normal tank pressure variance due to ambient temperature fluctuations. This construction eliminates contact alignment difficulties caused by deflections of the switch tank walls. The modular construction also allows testing of the module during assembly and complete flexibility in switch design and configuration. The nozzle which directs the flow of SF<sub>6</sub> has a converging/diverging geometry (see photo) which improves the arc interruption capability over designs using straight throated nozzles. The converging portion of the nozzle has a constantly decreasing flow area up to the nozzle throat minimizing velocity changes in the flow of SF<sub>6</sub> gas, while improving arc interruption and dielectric recovery.

**B.** As the contacts separate, the SF<sub>6</sub> is compressed by the piston assembly and directed into the arc zone by the nozzle. The compressed SF<sub>6</sub> flows (is puffed) across the contacts and around the arc established by the separating contacts. The cooling action of the gas is increased by the higher pressure (due to compression) and the flow which constantly provides a supply of cool SF<sub>6</sub> into the arc zone.

**C.** At current zero the temperature of the arc is reduced to the point of deionization, ceasing the flow of current. The SF<sub>6</sub> rapidly recovers dielectric strength withstanding the system recovery voltage across the contacts.

**D.** As the contacts are closing, the piston assembly compresses the SF<sub>6</sub> between the contacts. This increases the dielectric strength of the gap, minimizing prestrike. The contacts are designed using a tulip bayonet construction (see photo). The sliding action of the contacts on engagement provides a self cleaning action of the main current carrying surfaces. The contact fingers are designed for increasing contact pressure with increasing current for proper operation during momentary or close-into-fault conditions. The contacts have arc resistant copper tungsten tips to minimize erosion of material during load switching and prevent damage to the main current transfer area of the contacts.

# Contact Principles

## THREE POSITION, ROTARY PUFFER STYLE

For systems through 35kV, 630A continuous current with 40kA asym. momentary, 32kA asym. close into fault, and 25kA sym. one second current; rotary puffer (RP) style switches are used. G&W's multi-position spring operator permits an integral third switching position to increase the application capability over conventional two position switches. Three position switches combine increased switching flexibility with compact construction.

▲ Three position rotary puffer mechanism.

## THREE POSITION, ROTARY PUFFER CONTACT PRINCIPLE

**A.** The stationary contacts and the multi-chamber rotor (an assembly of interlocking parts which form a rotational framework including moving contacts) are housed in a clear cylindrical shell. The stationary contacts are supported independent of the cable entrance bushings, eliminating possible misalignment resulting from tank deflections. Tank deflections are caused by normal tank pressure variance due to ambient temperature fluctuations. Each rotating contact simultaneously disengages from two stationary contacts, providing two break points per phase. This provides improved interrupting capability as compared to single break contact systems.

**B.** As the rotor tube assembly turns to disengage the moving contact from the stationary contacts, dielectric media ( $\text{SF}_6$  gas) is compressed between the impeller and stator. The shell, phase barrier and rotor tube also act to confine the gas for proper compression and flow. The compressed  $\text{SF}_6$  gas is directed through the nozzle into the arc zone. The  $\text{SF}_6$  flows (is puffed) across the contacts and around the arc established by the separating contacts, cooling the arc over the length of the nozzle. The cooling action is increased by the higher pressure (due to compression) and the flow of gas which constantly provides a supply of cool  $\text{SF}_6$  into the arc zone.

**C.** At current zero, the temperature of the arc is reduced to the point of deionization. The  $\text{SF}_6$  gas rapidly recovers dielectric strength withstanding the system recovery voltage and preventing re-ignition of current across the contacts.

**D.** As the rotor tube assembly turns to engage the moving contact with the stationary contacts, the impeller induces a flow of  $\text{SF}_6$  gas between the contacts to minimize pre-strike.

## SWITCH REMOTE CONTROL PACKAGES

For electrical remote operation, motor actuators can be added. Various control packages are available:

### - Single way controls.

Either stationary or portable. Powered by 120 or 240VAC or up to 125VDC. AC powered controls are available with or without battery backup.

### - Multi-way controls

Switch controls, such as Schweitzer's SEL 451, are available for applications requiring one control to operate numerous switch ways on one switch or numerous switches from one control.

## LAZER® AUTOMATION

G&W's Lazer distribution automation system is a pre-engineered control package that works in conjunction with power distribution switchgear to perform automatic switching operations on overhead and underground loop distribution circuits. G&W utilizes over 100 years of industry experience to match the proper switchgear with the proper control for the application. Lazer solutions are available using the customer's preferred relay brand.

Lazer is a protection and control package that features one or more protective relays, equipped with distributed capabilities and peer-to-peer communication to make intelligent operating decisions and to monitor field conditions. Lazer focuses on critical load installations to maximize service reliability.

G&W's Lazer automation system specifically addresses fault detection, isolation and restoration (FDIR)

▲ Padmount switch with SEL controls.

requirements. It continuously monitors the circuit. When it senses an electrical overload or short circuit fault within its protection zone, it issues a command to the appropriate switchgear to trip-open within a pre-determined time delay based on the severity of the fault.

Communication with other upstream and downstream Lazer devices function continually to determine what other actions are required to reconfigure the circuits to automatically restore power to customers connected to the unfaulted lines. The entire process from fault detection to system restoration can typically be completed within 60 seconds or less.

### Communications

Flexible communication and open protocols are critical for integrating to existing Smart Grids and expanding to handle future needs. Lazer solutions offer flexible communication using hardwired connections, fiber optic cable, or a range of wireless technologies on RS232, RS485, and Ethernet ports.

Some of the different protocols available are:

- DNP 3.0
- SEL Mirrored Bits® (proprietary)
- IEC61850 with GOOSE messaging

### Project Examples

- Distributed automatic transfer including reclosers and SEL-451 controls over fiber optic cable.
- Open Loop FDIR including switches, ABB REC670 relays and ABB RTU560 HMI.
- Closed Loop FDIR including switches, SEL-351s and Survalent software.
- Open Loop Upgrade including switches, SEL-451 and SEL-751A over fiber optic.
- High Speed Single Phase Tripping Closed Loop including reclosers and SEL-651R over fiber optic cable.

## AUTOMATIC TRANSFER

### ATC 451

G&W ATC 451 automatic transfer controls are available for G&W SF<sub>6</sub> gas switchgear through 38kV. Switches can be dry or submersible vault, padmount or pole mount styles. The two incoming source ways can be located in one switch, or in two separate switches for added redundancy. Manual switches can be retrofitted in the field. Standard transfer times are within 8-10 seconds.

### Features

**Uses SEL-451 relay** - G&W's ATC 451 control utilizes the field proven Schweitzer SEL 451 relay for its protection logic and programming scheme.

**Plug and play construction** - The ATC 451 is pre-programmed and packaged with all required components to simplify installation and maximize reliable performance. Various styles of NEMA enclosures are available depending on the application.

**Overcurrent protection for two fault interrupting ways** - The ATC 451 can eliminate the need for separate vacuum interrupter controls. Depending on user preference and system protection schemes, various styles of separate interrupter controls are available.

**SCADA ready** - Each ATC 451 comes standard with several serial ports for communication to SCADA systems. Multiple protocols are available including DNP3.0 (standard), Mirrored Bits (standard), and IEC 61850 (option). Ethernet or fiber optic ports for communications are also available options.

**Lazer<sup>®</sup> ready** - The SCADA ready capability simplifies the requirements

▲ ATC 451 control panel.

for communication to other intelligent field devices for automatic power restoration schemes. This simplifies the integration of the ATC into any G&W pre-engineered Lazer automation system where automatic transfer is required.

**Generator source capability** - The 451 can be programmed to permit a standby generator to be used instead of a second utility source.

**Bus tie configurations** - The ATC 451 can be used with a bus-tie switch permitting automatic transfer where the load is normally balanced between two sources.

**User friendly controls** - Large pushbuttons are clearly labeled and provide easy control commands from the front panel.

**Sequence of event recorder** - Each ATC 451 includes a Sequence of Events Recorder which will record the last 1000 entries, including setting changes, powerups, and selectable logic elements.

**Flexible voltage sensing options** - Integral voltage sensing bushings are available which eliminate the need for cumbersome add-on devices. The bushings are 600A rated, fully submersible, and provide one analog output per phase and

one digital output per way for voltage monitoring. Elbow mounted sensors and potential transformers are also available.

### Faster Transfer Speed Options

Switches can be provided with internal cock-and-trip (stored energy) mechanisms permitting transfer times within 15-20 cycles. These switches incorporate an external, hookstick operable handle permitting manual open or close without having to disconnect the motor actuator. Contact G&W if faster transfer times are required.

## VACUUM INTERRUPTER CONTROLS

The control monitors the current, sends a trip signal which opens the vacuum interrupters and interrupts the fault current. G&W controls are self-powered from the current transformers located inside the solid dielectric module. Controls can be equipped to accept a trip input from a relay or communication device. G&W also offers other controls, such as SEL relays, depending on the application.

The standard control enclosure for padmount applications is

▲ Type 1 control

**Type 1** controls operate three, single phase vacuum interrupting mechanisms. The Type 1 control can be field set for either single phase or three phase trip mode. It is used on switches with either single phase reset or three phase reset handles. When in the three phase mode, all three phases trip if the selected trip level of any individual phase is reached. Trip level selections can be made under load or no-load conditions with 12 selectable minimum trip settings. Two ranges of minimum trip settings are available, 15 to 300 Amps and 30 to 600 Amps. Each unit is pre-programmed with 30 user selectable Time Current Characteristic (TCC) curves. The curve selection can be set or changed while the switch is energized.

An 8 pole dip switch allows the user to choose the TCC that best matches their individual coordination requirements. A label provides a key for the dip switch settings. The control can be factory preset to meet the user's requirements. As protection or coordination requirements change, settings can easily be changed while the switch is

energized. Pressing the manual trip button when the control is powered, electronically trips all three phases of the vacuum interrupter. Each control also includes "Last Cause of Trip" LEDs. These LEDs indicate which phase experienced an overcurrent condition, or that the control was given an external or manual trip command.

**Type 2** controls provide a user friendly interface for quick

▲ Type 2 control

and easy programming. Trip level selections can be made under load or no-load conditions with current ranges in 12 selectable levels. Two ranges of minimum trip settings are available, 15 to 300 amps and 30 to 600 amps. Each unit is pre-programmed with 30 Time Current Characteristic (TCC) curves. The curve selection can be set or changed at any time.

An 8 pole dip switch allows the user to choose the TCC curve which best matches their specific coordination requirements. The control can be factory preset to meet the user's requirements. As protection or coordination requirements change, settings can easily be changed in the field. Pressing the manual trip button when the control is powered up trips all three phases of the vacuum interrupter. Each control also includes "Last Cause of Trip" LEDs. These LEDs indicate what caused the control to issue a trip command - an over current condition, Ground Fault, Instantaneous, or an external or manual trip command.

**Type 2** controls offer the following features:

- Three phase protection
- Minimum trip setting for all three phases with one selector switch
- Adjustable phase time delay
- Ground fault (phase imbalance) for protection of large three phase motors or transformers. The ground trip setting is represented as a percent of the minimum trip setting.
- Instantaneous trip and inrush restraint features

# Accessories and Options

▲ Type 3 control

**Type 3 and 4** controls provide advanced protection functions. There are two versions of these controls, each with different protection elements.

The EZset version includes:

- Phase Minimum Trip
- Phase Time Delay
- Phase Instantaneous
- Phase Minimum Response
- Phase Inrush (Cold Load Pickup) Restraint
- Ground Fault (Phase Imbalance) Minimum Trip with a Separate Curve
- 30 Phase/Ground Fault Curve selectors

The Plus version includes all of the above, and in addition includes:

- Ground Fault Time Delay
- Ground Fault Instantaneous
- Ground Fault Minimum Response
- Ground Fault Inrush (Cold Load Pickup) Restraint
- 60 Phase/ Ground Fault Curves including 5 User Creatable Curves
- Maintenance Setting Group

The Type 3 and 4 controls record the 16 most recent Cause of Trip Events. The Type 3 EZset includes a display and keypad for entering programming parameters and viewing the Cause of Trip Events. The Type 3 Plus, and Type 4 EZset and Plus are only laptop programmable. It requires use of a laptop programming kit to enter the settings. The laptop programming kit can also be used to download and store the settings and Cause of Trip Events.

## PROGRAMMING KIT

### For Type 3 or Type 4

Provides software and cable connection to a laptop computer for programming or retrieving vacuum interrupter control information. The cable connects the USB port of the computer to the Vacuum Interrupter Control (Type 3 or 4)

## 3-1/C, 600A OR 200A VOLTAGE SENSING BUSHINGS

G&W's Voltage Sensing Bushing (VSB) system is a temperature compensated, built-in, voltage measuring system that eliminates the need for PTs when analog phase to ground voltage monitoring is required. Compared to potential transformers, the VS bushing system offers these benefits:

- Significant cost savings
- Cleaner, less cumbersome installation
- Less space required
- Fewer add-on components which could potentially fail
- Installed and tested prior to shipment
- Can be field calibrated

The VS bushing system utilizes a capacitively coupled screen which is embedded within the epoxy bushing. The low energy output of the screen can be directly read by some relays. Alternatively, the output is amplified by integral circuitry, resulting in a 0-120 VAC analog output suitable for direct connection to any relay, IED or RTU. The circuitry incorporates built-in calibration and temperature compensation which improve accuracy.

### 600A Voltage Sensing Bushings

Bushings are designed to IEEE 386 standards with standard interface accepting conventional elbow style connectors and include an aluminum conductor with 5/8"-11 aluminum threaded stud and aluminum single hole pad (**elbows must be ordered separately**). Bushings are bolt-on style. Copper studs are available. For bottom entry switches, recommended switch frame height is 42" for all voltages.

### 200A Voltage Sensing Bushings

Bushings are designed to IEEE 386 standards with standard interface accepting deadbreak or loadbreak inserts and conventional elbow connectors (**inserts and elbows must be ordered separately**). A copper conductor is standard. For bottom entry switches, recommended switch frame height is 42" for all voltages.

## SPECIFICATIONS

### General Ratings

Use on: Grounded wye systems  
 Operating temperature: -40°C to +65°C  
 Storage temperature: -50°C to +65°C

### Input Ratings

Input voltage range (phase to ground) options:  
 Low Energy: 1.2 - 4.61 or 4.62 - 21.9kV  
 Amplified: 1.7 - 6.2 or 6.2 - 21.9  
 Frequency range: 48Hz - 61.2Hz

### Output Ratings

Low Energy output voltage: 8 VAC  
 Low Energy Relay Input Impedance: 1M Ω  
 Nominal amplified output voltage: 120 VAC with digital output contact (1 per 3 phase set)  
 Digital pick-up voltage:  
     90% of Vnom (on all phases)  
 Digital drop-off voltage:  
     75% of Vnom (on any phase)  
 Maximum burden (per output):  
     0.06VA  
 Low Energy accuracy:  
     +/- 4% from -40°C to 65°C  
     (+/- 2% from -20°C to 65°C )  
 Amplified accuracy: +/- 5% from -40°C to 65°C

## 3-1/C, 600A QUIK-CHANGE APPARATUS BUSHINGS

Cable entrance bushings can be damaged at any time due to improper handling, accidental shifting during shipment, elbow failure or even normal wear and tear. In the case of SF<sub>6</sub> gas insulated switches where the tank is totally welded, conventional bushing replacement means sending the switch back to the factory for repair. G&W's exclusive Quik-Change Disconnectable Bushing permits quick, easy field replacement without having to open the switch tank.

Bushings are designed to IEEE 386 standards with standard interface accepting conventional elbow style connectors and include an aluminum conductor with 5/8"-11 aluminum threaded stud and aluminum single hole pad (**elbows must be ordered separately**). Copper studs are available. For bottom entry switches, recommended switch frame height is 42" for all voltages.

## 3-1/C, 600A / 900A APPARATUS BUSHINGS

Bushings are designed to IEEE 386 standards with standard interface accepting conventional elbow style connectors and include an aluminum conductor with 5/8"-11 aluminum threaded stud and aluminum single hole pad for a 600A rating (**elbows must be ordered separately**). A copper conductor is available which extends the continuous current rating to 900A. For bottom entry switches, recommended switch frame height is 42" for all voltages. Welded flange bushings are available.

## 3-1/C, 200A DEEPWELL BUSHINGS

Bushings are designed to IEEE 386 standards with standard interface accepting deadbreak or loadbreak inserts and conventional elbow connectors (**inserts and elbows must be ordered separately**). A copper conductor is standard. For bottom entry switches, recommended switch frame height is 42" for all voltages. Welded flange bushings are available.

## 3-1/C, 600A APPARATUS BUSHINGS

*Welded Flange style*

Bushings are designed to IEEE 386 standards with standard interface accepting conventional elbow style connectors. Bushings include a stainless steel flange and an aluminum conductor with 5/8"-11 aluminum threaded stud. **Elbows must be ordered separately**. 200A deepwell welded flange bushings are also available.

# Accessories and Options

## Gas Pressure Gauge and Fill Valve (Standard)

The pressure gauge is a “GO-NO-GO” style which is color coded to simplify verification of proper operating conditions. A Schraeder type fill valve permits refilling in the field. The gauge and fill valve are made of brass for corrosion resistance. Both components are protected by a steel guard.

## Low Pressure Warning Devices

are factory set at 5 psig and permit remote indication of internal tank pressure. It can also be used for low pressure control lock-out. One Form C contact is provided for wiring by the customer. **Recommended for installations where ambient temperature does not fall below 0°F (-15°C).**

## Temperature Compensated Gas Density Gauge (Optional)

measures internal tank gas density for maximum precision of switch operating conditions. The gauge is colored coded to simplify reading by operating personnel.

## SF<sub>6</sub> Density Switches

permit remote indication of internal tank gas density to assure proper pressure/temperature operating conditions. One Form C contact is provided for wiring by the customer. **Recommended for installations where ambient temperatures fall below 0°F (-15°C).**

## VI control window cover (Optional)

The standard control enclosure for pad-mount applications is fiberglass NEMA 4X (IP56) rated. The control is also available with an option for a fiberglass NEMA 4X (IP56) enclosure with a viewing window.

## Viewing Windows (Standard)

provide a means to visibly verify switch contact position. Single phase or three phase contact viewing is available.

## Ground Lugs (Optional)

are bronze, eyebolt style for 4/0 maximum conductor cable.

**For standard components, refer to typical specifications at [www.gwelec.com](http://www.gwelec.com) under Resources & Support.**

## Key Interlocks (Optional)

may be used as an added safety measure to prevent operation by unauthorized personnel or to assure safe coordination of energized equipment.

Switches can be provided with provisions only (two maximum per operating mechanism) or with key interlocks factory installed. Specify locking scheme when ordering, i.e. lock in open, lock in closed or lock in both open and closed position. For key interlocks to be coordinated with other equipment, manufacturer’s information must be provided.

# Accessories and Options

## OPTIONS

Select from the following options and add to the appropriate switch specification:

- Stainless steel tank, type 304
- Stainless steel enclosure, type 304 or 316
- Temperature compensating pressure gauge
- Low pressure warning device
- SF<sub>6</sub> density switch
- 4/0 brass ground lug
- Key interlock provisions
- Key interlocks to lock in open position
- Current transformers for load break ways
- Potential transformers for voltage monitoring and/or control power
- Automatic transfer control type ATC451
- Motor actuators for remote switch operation
- Auxiliary switches for remote switch position indication
- Stationary switch controls for remote switch operation and SCADA integration
- Portable switch controls for remote switch operation
- Remote terminal units and communication packages for SCADA integration
- Operation counters
- Voltage sensors with 120 VAC output or a contact to indicate presence of voltage
- 200A deepwell bushings
- 600A apparatus bushings
- 200A voltage sensing bushings
- 600A voltage sensing bushings
- 600A Quik-Change apparatus bushings
- 600A Universal bushings (through 25kV)
- Type 2 vacuum interrupter control including ground fault trip and time delay selector switches (three phase only)
- Type 3 vacuum interrupter control including ground fault trip, inrush restraint, programmable vacuum fluorescent display (VFD)
- Type 4 vacuum interrupter control (same as Type 3 with laptop programming only)
- Clear window cover for Type 1, Type 2, or Type 3 interrupter controls
- Submersible NEMA 6P enclosure or IP68 potted Type 4 for vacuum interrupter control
- SEL relays including 451 and 751A
- ABB relays including REF615, REF620, and REC670
- GE relays including 350, F35, and F60
- External power / trip for vacuum interrupter control
- Refill kit consisting of regulator, hose and SF<sub>6</sub> bottle
